ABOUT ME

Kalina Iwaszko

I'm a UX/UI & Motion Designer experienced in cross-platform digital products for AI and health-tech startups.

I work end-to-end — from research and prototyping to design systems and developer collaboration — with a solid grasp of front-end fundamentals (HTML, CSS, JavaScript, React) to ensure smooth handoff and agile iteration.

CASE STUDY

Neptune HCP

Enabling Neurologists to **Identify** Advanced
Therapy Candidates **Faster**

Role: UX/UI Designer

Company: Orbit Health GmbH

Timeline: June 2024 – September 2024

ONEPTUNE

OVERVIEW

Adding a new feature to a complex app

Orbit Health's Neptune HCP is a **web platform for neurologists** treating **Parkinson's Disease (PD) patients**.

To strengthen partnerships with advanced therapy providers, Orbit needed to integrate a new feature that would **flag potential candidates for advanced therapies directly within the physician dashboard**.

The 5-2-1 Criteria feature would use manual logs and wearable-based data from the Neptune system to **automatically highlight patients who may meet the criteria for advanced treatment**.

This addition would allow neurologists to spot potential candidates **at a glance** — a process that previously required extensive manual assessment.

CHALLENGE

Turning Clinical Criteria into Actionable UX

The challenge was to translate the 5-2-1 **medical criteria** into a clear, actionable interface for busy clinicians:

5 doses of medication per day AND at least 2 hours of "OFF" state AND/OR at least 1 hour of dyskinesia

Neurologists needed to see this information quickly, understand its meaning, and identify which patients may qualify for advanced therapy.

The design also had to **fit seamlessly within the existing Neptune HCP dashboard layout**, ensuring **no disruption** to established workflows.

UX/UI requirements

SOLUTION

A Clear, Data-Driven Visualization

The final wireframes presented an embedded 5-2-1 indicator within each patient card, making the data visible without disrupting the main dashboard workflow.

Key features included:

- At-a-glance visualization of the 5-2-1 score directly in the patient list
- Color and icon cues to indicate when thresholds were met or exceeded
- Contextual tooltips for medical clarity
- Seamless integration with patient details view for quick follow-up

The design ensured that neurologists could instantly recognize potential advanced therapy candidates — turning a complex evaluation into a simple, visual insight.

Final design – main screen

PROCESS

Iterating on an Existing Design

Working alongside another UX/UI designer, I helped develop wireframes for integrating the 5-2-1 feature into the existing dashboard. We each explored different concepts, discussed interaction logic, and presented alternative wireframes to the product and clinical teams.

After several rounds of stakeholder feedback, we refined the design to meet all functional and visual requirements outlined in the product brief — balancing clinical accuracy with ease of interpretation.

All screens were designed in Figma, maintaining alignment with Neptune's design system and information hierarchy.

Patient List	OFF Periods (avg)	DYS Periods (avg)	Daily Doses (avg)	Medication Type	5 Doses/Day	2 Hours OFF	1 Hour Dyskinesia	Potential Candidate
John Doe	3 hours/day	5 hours/day	6	Levodopa	Yes	Yes	Yes	YES
Jane Smith	5 hours/day	3 hours/day	5	Dopamine Agonist	Yes	Yes	No	NO

Understanding feature core logic

ITERATIONS

Initial dashboard layout

2 assessment status control by "Switcher"

83 % Audit

n/a % Audit

Toggle to include/exclude patient in 5-2-1 calculation manually by clinician

OUTCOME

From Brief to Approved Design

Throughout the six-week process, I worked closely with the Product Manager and Head of Product, incorporating feedback from both clinical and technical perspectives.

While not the lead designer, I played an important role in shaping the information layout, interaction flow, and visual logic for the feature's integration.

The final concept was approved by stakeholders and scheduled for implementation as part of the trial rollout.

CASE STUDY

Buhdi – Mindful ADHD Support App

Designing for **User Engagement** and **Retention**

Role: UX/UI Designer

Timeline: December 2024 – March 2025

OVERVIEW

Designing Neurodivergent-Friendly UX

Buhdi is a mindful, **AI-powered task management app** designed for adults with ADHD. Buhdi offers a flexible, **gamified experience**—guided by a calming AI coach—to help users complete meaningful goals at their own pace.

I joined the project early in MVP development and worked closely with the founder to shape both the core product experience and branding.

My goal was to design an experience that was not just functional, but **emotionally supportive** and truly tailored to ADHD users' needs.

CHALLENGE

Turning Disengagement into Motivation

- ADHD users easily **disengage** with rigid, overwhelming productivity apps but need a system that helps them with **task execution**
- The flow needed to **motivate**, not overwhelm → turn tasks into **calming, rewarding** flows.
- Paywall meant onboarding had to quickly build **trust** and **value**.

TASK MANAGEMENT FUNCTIONALITY

To help users with ADHD overcome 'task paralysis,' this flow integrates supportive functionalities into a simple to-do list, making it easier to begin tasks.

Task List Screen

Task Actions Panel

SOLUTION

Designing Structure and Story for Engagement

- Designed **Quest Mode** → breaks goals into small, motivating steps
- Designed onboarding based on feedback, improving **clarity** and **reduced drop-off**.
- Built pleasing brand system with Buddhist-inspired visuals & AI coach persona.
- Integrated **gamified elements** (progress, rewards, levels) to boost engagement.
- Designed engaging UI with **accessibility** in mind

PROCESS

Applying User-Centered Design

- Conducted **user interviews** & **desk research** on ADHD needs and pain points
- Applied mindfulness and **gamification** principles to design flows
- Created low-fi wireframes to test **navigation** and reduce **cognitive load**
- Worked closely with founder and developer
- Conducted **user testing** and iterated based on it

Prototype

MVP Concept

Final Concept

HIGHLIGHTS

Home Tab

Quest Tab

Chatbot Tab

OUTCOME

Validated by Users, Live in the App Store

- The app was successfully **launched** on the App Store and secured its **first paying users**
- User testing confirmed that Quest Mode felt **engaging** and **motivating**
- **Learned:** importance of inclusive design for neurodiverse audiences + balancing business goals (engagement, retention) with empathy.

Iterations After User Testing:

- Short, concise flow
- Removing user Quiz
- clearer value proposition
- Paywall at the end of the Flow

USERS' FEEDBACK

"The design feels simple and friendly."

"The onboarding was quick and clear — I didn't get lost or bored."

"I like colors and Buhdi character, reminds me Master Yoda."

CASE STUDY

Caspar Health

Boosting **User Retention** via Optimized Video
& Motion Content Strategy.

Role: Motion Designer & Creative Producer

Timeline: 2020 – 2022

OVERVIEW

UX-Driven Video Design

Caspar Health is a Berlin-based digital healthcare company providing **remote rehabilitation** and **physiotherapy** programs for patients recovering from surgery or managing chronic conditions.

The app offers access to educational and exercise videos created by medical professionals.

CHALLENGE

Boosting Retention with Video Design

When I joined Caspar Health, the video content was **functional but not user-friendly**: long, static, and heavily animated medical lectures that caused viewers to drop off early.

My goal was to redesign and optimize the video experience to make it more **engaging, digestible, and aligned** with user behavior — effectively applying UX thinking to content design.

Users were dropping off after a few minutes of video play, and internal metrics showed low completion rates and high churn.

Initial video content style

SOLUTION

The final video content strategy delivered noticeable **increase in user watch time** and repeat sessions, **reduced production time** per video and **positive feedback** from patients and medical staff.

The improved visual design, pacing, and human connection helped boost user retention and satisfaction, as confirmed by the app's engagement metrics after release.

The UX researcher tested both content types — animated vs. live-action — with users. Results showed:

- Users preferred live-action videos for authenticity and emotional connection.
- Viewer preference correlated with the speaker's persona — older, empathetic female speakers received higher engagement scores than younger, "perfect" looking hosts.

These findings helped us define new casting and content guidelines to ensure ongoing viewer engagement.

Video reel

PROCESS

UX Thinking for Video Content

I approached the project like a UX problem, focusing on improving user retention and motivation by:

- Splitting existing long-format videos into shorter, modular segments based on the hypothesis that users prefer shorter, more focused lessons and would be more likely to return regularly.
- Designing new videos for clarity and emotional impact. Rhythmic editing and selective motion graphics made the content more engaging and easier to follow.
- Developing hybrid content production model: filming live speakers delivering the medical webinars, combined with targeted motion graphics for key moments. This reduced production time dramatically and allowed for more human, relatable communication.

New video content style

Thank you
